Bilbies

Bunnies

Greater Bilby

Rabbit

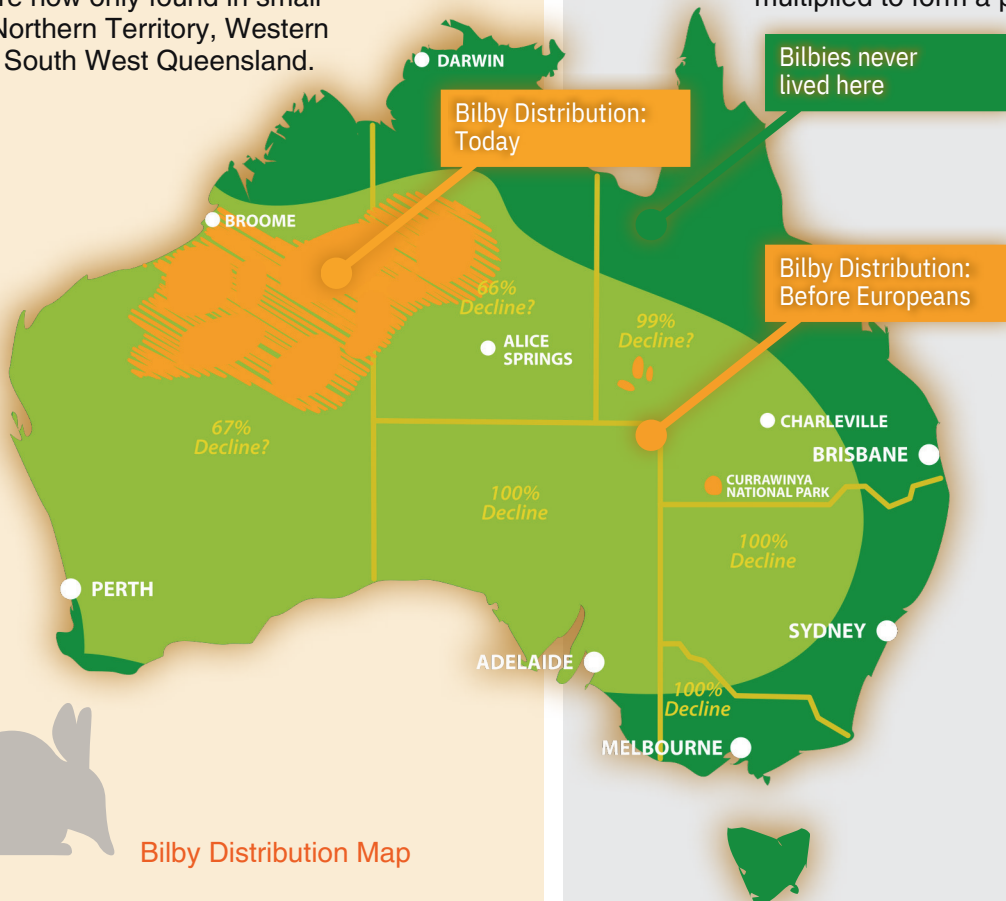

Bilbies

The Greater Bilby was once found on 70% of Australia. Since European settlement 90% of the previous population has been lost. Bilbies are now only found in small areas of the Northern Territory, Western Australia and South West Queensland.

Distribution

Bunnies

The European rabbit is not native to Australia. In 1859, 24 rabbits were introduced to Australia and have since multiplied to form a population of over 600 million in just over a century.

Bilbies

Habitat

Bunnies

Bilbies live in grasslands and mulga scrublands in the hot, dry, arid and semi-arid areas of Australia, where temperatures can get to over 45°C in summer.

Rabbits live anywhere they can find food .

Bilbies live in spiralling burrows which they dig up to 2 metres deep and 3 metres long. This depth helps to keep them safe from predators and also to keep them at a constant temperature of 23°C.

Rabbits take over bilbies burrows, we would then call this a warren.

Rabbits are social and territorial animals, living in medium-sized herds of approximately 5 adults and their young.

Bilbies

Diet

Bunnies

Omnivores:

Bilbies eat bulbs, fruit, seeds, fungi, insects, worms, termites, small lizards and spiders.

Herbivores:

Rabbits grazers, but grass is their primary food source. They nevertheless have a diverse diet of grasses, leaves, buds, tree bark, and roots. They ringbark young trees and do not allow for vegetation to grow back.

Water:

Bilbies don't need to drink water regularly because, like the koala, they get most of their moisture from their food.

Water:

Similar to bilbies, rabbits can get their water needs from their diet

Bilbies

Description

Bunnies

The Greater Bilby is a nocturnal marsupial that has a silky light grey and white coat and a long black and white crested tail with a naked spur-like tip. Bilbies have a long snout and a well-developed sense of smell to aid in finding food. Their large, hairless ears are extremely useful for listening for predators as well as prey.

The European rabbit is a smallish, grey-brown (or sometimes black) medium-sized mammal. It ranges from 34 to 50 cm in length; weight can range from approximately 1.1 to 2.5 kg.

Reproduction

Bunnies

Marsupials (pouched young):

For an Australian marsupial, the Bilby is a fast breeder, with a gestation period of 12 to 14 days.

They stay in the mother's pouch between 75 and 80 days and are independent 2 weeks later.

Female Bilbies are ready to breed at 6 months.

Number of Babies per Litter:

Bilbies usually have 1 or 2 babies per litter, and can have triplets which is rare.

Litters per Year:

During a good season (boom times), a pair of bilbies can have up to 4 litters per year.

The maximum number of babies for one female bilby per year is 14.

14
Baby Bilbies per Year

Mammals:

Rabbits are very, very fast breeders.

Their gestation period is 31 days.

A female rabbit is ready to reproduce from 3 to 4 months of age and a mature female rabbit can be pregnant continuously for up to 8 months of a year.

Number of Babies per Litter:

Rabbits can have up to 12 babies per litter.

Litters per Year:

Rabbits can have from 4 to 7 litters per year.

The maximum number of babies for one female rabbit per year is 84.

84
Baby Rabbits per Year

Bilbies

Bunnies

Bilbies are only active at night

Rabbits most active at dawn and dusk

Bilbies

Nocturnal:

Bilbies are truly nocturnal and are only active in the darkness of night. They don't emerge from their burrows until after dusk and retreat at least an hour before dawn.

A full moon, strong winds and and heavy rain can keep a bilby in its burrow all night.

Omnivores:

Bilbies are well adapted to the harsh arid and semi-arid environment by eating most of what they can find and do not require water.

Ears:

Bilbies have excellent hearing and also use their ears to cool themselves off by pumping blood into the tiny veins of their ears.

Pouch:

The backward opening pouch of the female bilby prevents the pouch from getting dirty when they are digging burrows or scratching for food.

Adaptation

Bunnies

Crepuscular:

Rabbits are most active around dawn and dusk.

At night they move into open ground to feed.

Rabbits can eat up to a third of their body weight a day.

They are able to breed prolifically.
